

The Agentic AI & Gig-Economy Ops Blueprint

PREPARED FOR

UniUni Logistics

ARCHITECT

Bhrigu Aneja

FOCUS AREA

Last-Mile Autonomy

01 The Objective

Scale from 200k daily parcels to *Million-Scale Autonomy*.

UniUni has mastered the variable-cost gig model. The next leap isn't just more drivers—it's an Autonomous Orchestration Layer that manages 40,000+ personal vehicles as a single, reasoned intelligence.

02 Pillars of Transformation

ORCHESTRATION Dynamic Fleet Intelligence THE PROBLEM Static zone-based dispatching creates "empty-mile" waste. THE SOLUTION Agentic dispatchers that re-negotiate routes in real-time with drivers.	THE EDGE Robotic Sortation Mesh THE PROBLEM Warehouse sorting telemetry is siloed from driver-app data. THE SOLUTION Unified data architecture connecting GRS robots to the driver's seat.	CROSS-BORDER Autonomous Compliance THE PROBLEM US-to-Canada customs documentation is high-friction manual work. THE SOLUTION LLM-agents that reason over customs laws to automate data ingestion.
---	--	---

03 The Opportunity Map

DRIVER EXPERIENCE (DX) 1 Static App Support → Agentic Driver Assistants	LLM-assistants that handle package disputes and navigation troubleshooting for 40k drivers without scaling support staff.
OPERATIONAL VISIBILITY 2 Reactive Dashboards → Predictive Delay Reasoning	Agents that ingest weather, traffic, and border-wait data to "reason" through alternate routing before delays occur.
ENTERPRISE INTEGRATION 3 Manual API Mapping → MCP Action Layers	Using Model Context Protocol to connect Shopify/Temu data directly to UniUni sorting logic with zero code drift.

04 Next Steps

- Series D Growth Audit

Identifying data bottlenecks in the 2026 U.S. expansion roadmap.
- Agentic Fleet POC

Deploying a reasoning engine for a single high-density sorting hub.
- Autonomous Scale-out

Global rollout across the North American warehouse mesh.
